

FHCM is founded on the strength of career-long relationships and professional compatibilities which were formed while the four FHCM partners were with The Architects Collaborative (TAC). All four FHCM principals are recognized both individually and collectively for their outstanding achievements and proven project management capabilities.

"We endeavor to reach beyond the basic requirements of structure, convenience and economy. The architect has a responsibility, using appropriate technologies of his time, to respect the context of the site and surroundings and to develop successful, elegant and enduring design solutions, not for their own sake, but for the contribution they make toward more human cities, neighborhoods, and interior environments."

Enduring  
and  
Human  
Environments

Fletcher Harkness Cohen Moneyhun, (FHCM) is an architecture, planning, urban and interior design firm providing services to education, transportation, governmental, healthcare, housing, corporate and developer clients in both the public and private sectors. Established by Norman C. Fletcher FAIA, John C. Harkness FAIA, Michael D. Cohen AIA, and Gary N. Moneyhun AIA, the firm offers its clients a seasoned team of design professionals with a fresh and energetic design perspective.

"What drew the four of us together to form this new partnership is the fundamental belief that eloquent and enduring design arises from teamwork - the open, inclusive and creative collaboration of client, architect, user and place.

We believe in a collaborative design process because we find it produces fresh, honest and exciting buildings which stand the test of time both physically and spiritually - in other words, buildings that inspire."

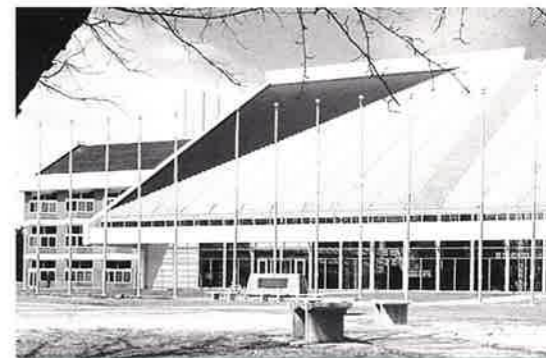

"We begin each assignment with no preconceptions. Then, we listen.

We listen to the client, exploring their needs, expectations and resources. We listen to the place, immersing ourselves in the singular characteristics of the project's site and the natural forces and formal vocabulary of its physical context. And we listen to the users who will actually be living with the building, enriching our understanding of how the building will work best."

**A.I.A. Headquarters Building**

Commissioned by a national committee of AIA architects, the project required a modern functional headquarters building together with preservation of the historic Octagon and garden.

**Noble Research Center, Oklahoma State University**

Located at the center of campus, this prize winning project designed in association with Frankfort-Short-Bruza, utilizes many energy conserving strategies.

**O'Neill Library, Boston College**

This state of the art research facility is designed to house the universities main collection of 820,000 volumes and a student computer terminal area.

"It is our job to generate a creative team dialogue with what we hear, and to support and move that dialogue forward into design with the technical and interactive skills each of us has developed over many years of solving all kinds of design puzzles with complicated agendas, many participants, and difficult construction issues. We have found that, during this process, the design solution ultimately reveals itself, often with such force, logic and clarity as to seem inevitable. The process is not mystical at all, but rather a very real expression of the power of collaboration."

**CIGNA Headquarters**

This new building on the CIGNA campus accents energy conservation with its controlled sky lighted atrium.

**Martin County Public Library**

With stucco and glass, this light filled library provides an appropriate civic image for an attractive Florida community.
